

## Writing Plan

1. Create a multi-table relational database using phpmyAdmin that will be used to store information about a mini vehicle and its 3 model types.
2. Consider what information would be relevant in order to inform the user about what makes each model type different.
3. Using this data along with PHP you will create an API to pass this information to the front-end.
4. Create a dynamic one-page app based on the database.
5. Make it show more content / data when clicking the model.
